Unable to upload big files

It can happen that MXSuite fails when uploading a file larger than 30 MB.
When you expect that MXSuite will upload the file, the upload will never happen.

This can be related to a missing setting in the file: applicationHost.config.
You can find this file in C:\Windows\System32\inetsrv\config

The following line must be added:

```
<requestLimits maxAllowedContentLength="262144000" />
```

This line must be added between

```
 <security>
 <requestFiltering>
[Other commands]

 </requestFiltering>
 </Security>
```

Example below:

```
                <add fileExtension=".refresh" allowed="false" />
                <add fileExtension=".compiled" allowed="false" />
                <add fileExtension=".msgx" allowed="false" />
                <add fileExtension=".vsdisco" allowed="false" />
                <add fileExtension=".rules" allowed="false" />
            </fileExtensions>
            <verbs allowUnlisted="true" applyToWebDAV="true" />
            <hiddenSegments applyToWebDAV="true">
                <add segment="web.config" />
                <add segment="bin" />
                <add segment="App_code" />
                <add segment="App_GlobalResources" />
                <add segment="App_LocalResources" />
                <add segment="App_WebReferences" />
                <add segment="App_Data" />
                <add segment="App_Browsers" />
```

```
            </hiddenSegments>
        </requestFiltering>
        <requestLimits maxAllowedContentLength="262144000" />
    </security>
```

After the file is saved, a restart of the IIS Server is required.

> Administrative rights of this folder must be present for the current user
