

How do I set my password policy?

1. Go to **Administration > Users > Settings**
2. Enable the tickbox for **Password strength**

The screenshot shows the 'Administration > Users > Settings' path in the top navigation bar. On the left is a sidebar with various system icons. The main content area is titled 'Users' and has tabs for 'Users', 'User groups', and 'Settings'. Under 'Settings', there is a 'General settings' section with a 'Password strength' checkbox that is checked. Below this, there are five input fields with up/down arrows for configuring password requirements:

- Minimum length: 8
- Minimum number of lower case characters: 2
- Minimum number of upper case characters: 2
- Minimum number of digits: 2
- Minimum number of non-alphanumeric characters: 2

3. Configure your password strength
 1. Fill in the minimum length of a password. Recommended is a minimum of 8 characters.
 2. Configure the policy of character types:
 - *Lower case* example: abcdefg
 - *Upper case* example: ABCDEFG
 - *Digits* example: 123456
 - *Non-alphanumeric* example: !@#\$%^&
4. Click on **Save**.

Note:

If the password policy is changed, it will be changed for the entire fleet (office + all other locations)

If the current password of a user does not comply with the password policy, the user is requested to change the password immediately at login.
